Test Report Nr. B 21.15.223.01 (en)

Order: Determination of the spectral reflection coefficient of paint coatings in the range of 280 nm to 2500 nm of samples provided by the client.

Customer: MIG Material Innovative Gesellschaft mbH
Am Garock 3
D-33154 Salzkotten

Contractor: Institute for Materials Research and Testing
at the Bauhaus-University Weimar
Department of Building Physics & Non-Destructive Testing

Date of order: 2015-07-16

Test object: Glass probes with paint coating

Weimar,
2015-12-08

By order

Dipl.- Ing. A. Freyburg
Head of department

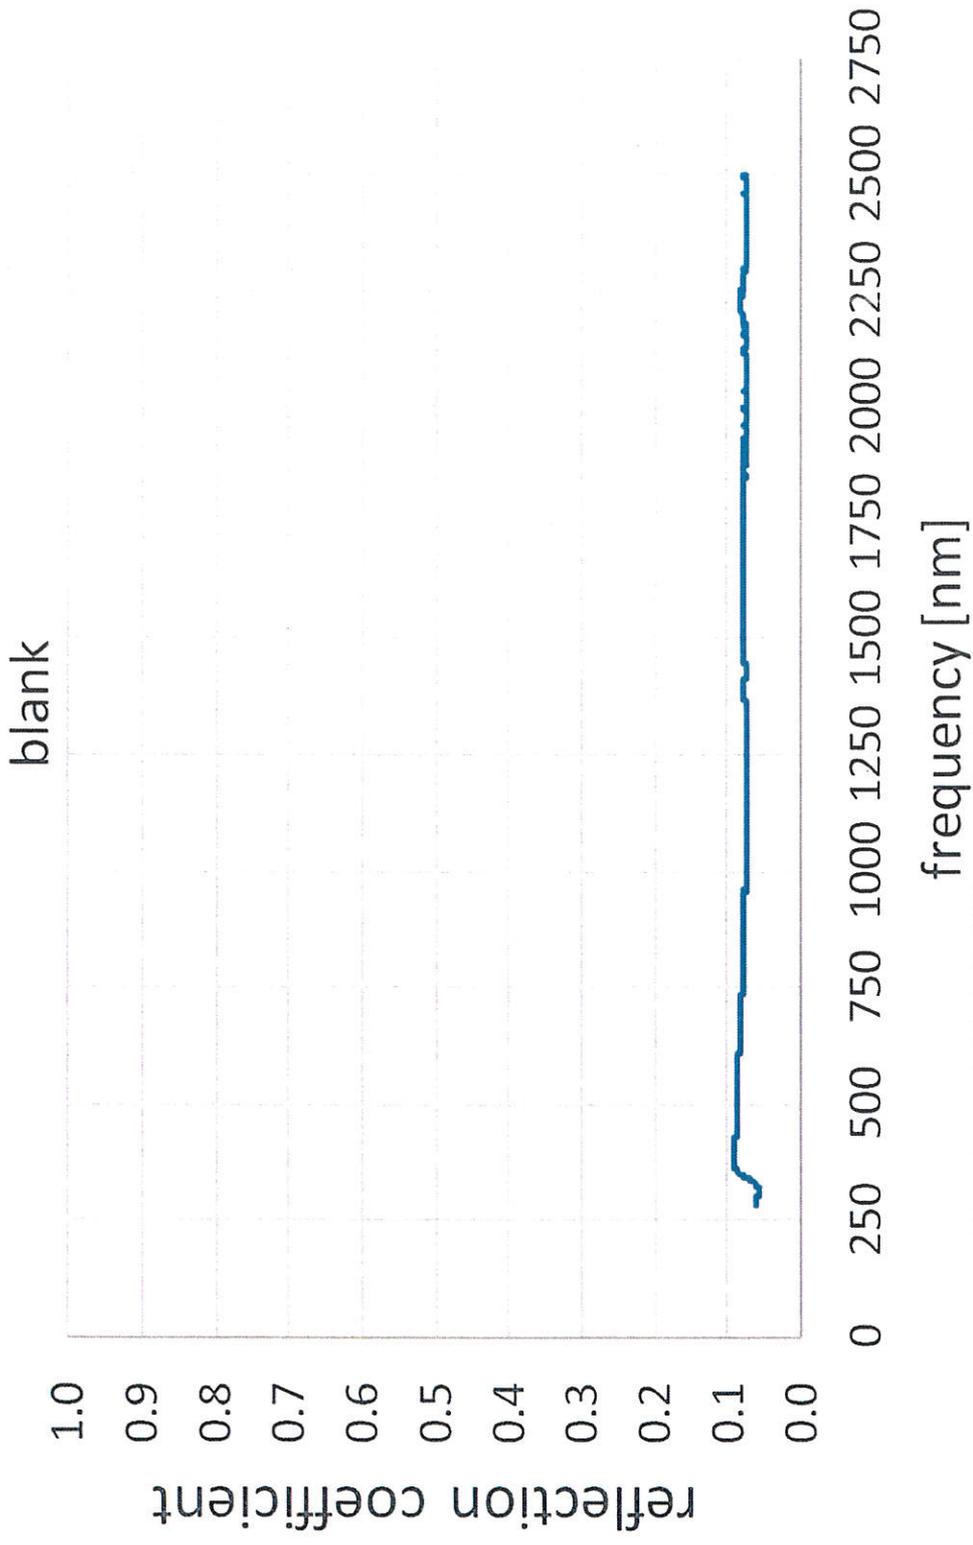

Dr.- Ing. S. Helbig
scientific assistant

Results

From the sample ,blank' both supplied specimens were used for the measurement. Each specimen was measured at two different locations. Table 2 shows the mean values (two probes and two locations) at selected wavelength. In a higher resolution the data are listed on the CD accompanying the german report.

Table 2: The reflection coefficient between 280 nm und 2500 nm at a sampling rate of 50 nm for the sample blank.

wavelength [nm]	reflection coefficient (absolut)	wavelength [nm]	reflection coefficient (absolut)	wavelength [nm]	reflection coefficient (absolut)
2500	0.0761	1700	0.0777	900	0.0777

The spectrum of the diffuse reflectance of the sample 'blank'.

From the sample ‚ESP Außen‘ both supplied specimens were used for the measurement. Each specimen was measured at two different locations. Table 3 shows the mean values (two probes and two locations) at selected wavelength. In a higher resolution the data are listed on the CD accompanying the german report.

Table 3: The reflection coefficient between 280 nm und 2500 nm at a sampling rate of 50 nm for the sample ESP Außen.
